2194

MAIL DATE

DELIVERY MODE

05/21/2008

PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary	Application No. 10/610,689	Applicant(s) CARRELL ET AL.	
	Examiner NATHAN PRICE	Art Unit 2194	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 14 February 2008.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-11, 14-20, 23-29 and 32-36 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-11, 14-20, 23-29 and 32-36 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

1. Claims 1 – 11, 14 – 20, 23 – 29 and 32 – 36 are pending.
2. This Office Action is in response to communications received 14 February 2008. Previous objections and rejections not included in this Office Action have been withdrawn.

Response to Arguments

3. Applicant's arguments with respect to claims 1 – 11, 14 – 20, 23 – 29 and 32 – 36 have been considered but are not persuasive or are moot in view of the new ground(s) of rejection. See the current rejections regarding limitations added by amendment.
4. Applicant's interview summary indicates that Examiner agreed that proposed amendments appeared to overcome all rejections of record. However, only an amendment to claim 1 was proposed, discussed and considered during the interview (see interview summary mailed 11 February 2008). The reference currently relied upon to teach the added feature of claim 1 was not included in the rejection of claim 1, but was included in the rejection of other claims in the previous Office Action. Therefore, although Applicant indicates that all independent claims have been amended in a way

similar to claim 1, the previous grounds of rejection of claims other than claim 1 have not necessarily been overcome.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

5. Claims 1 – 6, 8 – 11 and 32 – 36 are rejected under 35 U.S.C. 103(a) as being unpatentable over CTRC (see reference V on PTO-892 mailed 31 August 2007) in view of Taylor (see PTO-892 mailed 22 August 2006 and 31 August 2007 and 14 November 2007), Coulouris (see PTO-892 mailed 14 November 2007) and Marcos et al. (US 6,347,342 B1; “Marcos”).

6. As to claim 1, CTRC teaches a method of enabling a first system to use a second system [p.5 ¶4 – p.6 ¶2] comprising:

generating at the first system, a first request directed to the second system, said first request being in a form adapted for the first system but not for the second system [p.5 ¶4 – p.6 ¶2];

performing a first conversion of said first request to produce a second request, said second request being in a form adapted for said second system but not for said first system [p.5 ¶4 – p.6 ¶2];

invoking the processing of said second request by the second system [p.5 ¶4 – p.6 ¶2];

receiving a first reply from the second system [p.5 ¶4 – p.6 ¶2];

performing a second conversion of said first reply to produce a second reply that comprises header information that is usable with an Internet protocol [p.5 ¶4 – p.6 ¶2]; and

providing said second reply to said first system [p.5 ¶4 – p.6 ¶2].

7. CTRC fails to specifically disclose an FMH7 field of an SNA protocol. However, Taylor discloses error information comprising an FMH7 field of an SNA protocol [page 68: FMH7]. When combined, the references disclose that said error-handling object creates header information representative of the contents of said FMH7 field [Taylor: page 68: FMH7], said header information being adapted for use with a TCP protocol [CTRC: p.5 ¶4 – p.6 ¶2; Taylor: page 386 ¶ 2, integration of TCP/IP and SNA]. It would have been obvious to one of ordinary skill in the art at the time Applicant's invention was made to combine these references because both references disclose providing communication between different systems, specifically SNA and TCP/IP.

8. CTRC also fails to specifically disclose a host initiated processing (HIP) system, listeners, HIP proxies and pre-stored configuration information as claimed. However, Taylor discloses said first conversion performed using a host initiated processing (HIP) system that includes one or more listeners for receiving the first request and one or more HIP proxies that handle flow control for the first conversion [p.138 “proxy”; p.314 ¶1; p.909 ¶ for “connection server”]. Furthermore, Coulouris teaches pre-stored configuration information to limit the number of threads that service requests [p.356 ¶4]. When combined with Taylor, the references teach the number of listeners and HIP proxies to use in the first conversion is determined by an HIP runtime service based on pre-stored configuration information. It would have been obvious to one of ordinary skill in the art at the time Applicant’s invention was made to combine these teachings because Coulouris teaches details of servers that are applicable to CTRC and Taylor.

9. CTRC fails to specifically disclose the HIP system further including a first object to read conversion information from a file that explains how to translate data types from the first system to the second system to a particular flow control and a second object to access end-to-end mapping information from the file to a particular flow control as claimed. However, Marcos teaches a first object to read conversion information from a file that explains how to translate data types from the first system to the second system to a particular flow control and a second object to access end-to-end mapping information from the file to a particular flow control [col. 4 lines 1 – 45]. It would have been obvious to one of ordinary skill in the art at the time Applicant's invention was

made to combine these references because both CTRC and Marcos disclose integrating different systems by providing communication between otherwise incompatible communication protocols and systems.

10. As to claim 2, CTRC discloses that said first request comprises a datum in a first format, and wherein said act of performing said first conversion comprises converting said datum to a second format different from said first format, said second request comprising said datum in said second format [p.5 ¶4 – p.6 ¶2].

11. As to claim 3, CTRC discloses that said first request comprises a datum having a first type and wherein said act of performing said first conversion comprises converting said datum to a second type different from said first type, said second request comprising said datum in said second type [p.5 ¶4 – p.6 ¶2].

12. As to claim 4, CTRC discloses that said first type is supported in said first system but not in said second system [p.5 ¶4 – p.6 ¶2].

13. As to claim 5, CTRC discloses that said second type differs structurally from said first type in at least one aspect [p.5 ¶4 – p.6 ¶2].

14. As to claim 6, CTRC discloses that said first request comprises a call using a first mechanism to a software object in the second system, and wherein said act of

performing said first conversion comprises converting said call for use with a second mechanism different from said first mechanism [p.5 ¶4 – p.6 ¶2].

15. As to claim 8, CTRC discloses that said first request comprises a remote call according to a first protocol, wherein said second request comprises a remote call according to a second protocol different from said first protocol, and wherein said act of performing said first conversion comprises preparing said second request to correspond substantively with said first request and to work in accordance with said second protocol [p.5 ¶4 – p.6 ¶2].

16. As to claim 9, CTRC discloses that said first protocol calls for invocation to be performed with a bidirectional interaction between a caller and a callee, wherein said second protocol calls for an invocation to be performed in a unidirectional call message from said caller to said callee [p.4 ¶5; p.5 ¶4 – p.6 ¶2], and wherein said act of preparing said second request comprises:

- engaging in an interaction with the caller on the first system to obtain information relating to a call [p.5 ¶4 – p.6 ¶2];
- collecting said information [p.5 ¶4 – p.6 ¶2]; and
- preparing said second request using the collected information [p.5 ¶4 – p.6 ¶2].

17. As to claim 10, CTRC discloses said first system is adapted to communicate a remote call according to a first network protocol, and wherein said first and second requests, and said first and second replies, are transmitted using a second network protocol different from said first network protocol, and wherein said acts of performing first and second conversions comprise: including in said second request and said second reply header information that corresponds to information that is contained in requests or replies according to said first protocol [p.5 ¶4 – p.6 ¶2].

18. As to claim 11, CTRC discloses that said first request comprises a call to a software object in said second system, and wherein the form of said first request is adapted for making requests from the first system to a remote system that is of the same type of environment as the first system [p.5 ¶4 – p.6 ¶2].

19. As to claims 32, 33, 35 and 36, see the rejection of claim 1.

20. As to claim 34, see the rejection of claim 2.

21. Claims 23 – 29 are rejected under 35 U.S.C. 103(a) as being unpatentable over CTRC (see reference V on PTO-892 mailed 31 August 2007) in view of Taylor (see PTO-892 mailed 22 August 2006 and 31 August 2007 and 14 November 2007), Coulouris (see PTO-892 mailed 14 November 2007), Marcos et al. (US 6,347,342 B1; “Marcos”) and Sun et al (US 6,442,663 B1; “Sun”).

22. As to claim 23, CTRC teaches a system to enable a first software object in a first environment to call a second software object in a second environment, the system comprising:

hardware comprising at least one processor [inherent];

a service object that executes on said hardware and that receives a first request from the first software object, converts the first request into a second request which is in a form usable by the second software object, and presents the second request to the second software object [p.5 ¶4 – p.6 ¶2].

23. CTRC fails to specifically disclose a host initiated processing (HIP) system, listeners, HIP proxies and pre-stored configuration information as claimed. However, Taylor discloses a host initiated processing (HIP) system that includes one or more listeners for receiving the first request and one or more HIP proxies that handle flow control [p.138 “proxy”; p.314 ¶1; p.909 ¶ for “connection server”]. Furthermore, Coulouris teaches pre-stored configuration information to limit the number of threads that service requests [p.356 ¶4]. When combined with Taylor, the references teach the number of listeners and HIP proxies to use in the first conversion is determined by an HIP runtime service based on pre-stored configuration information. It would have been obvious to one of ordinary skill in the art at the time Applicant's invention was made to combine CTRC and Taylor because both references disclose providing communication between different systems, specifically SNA and TCP/IP. It would have been obvious to

one of ordinary skill in the art at the time Applicant's invention was made to combine Coulouris with CTRC and Taylor because Coulouris teaches details of servers that are applicable to CTRC and Taylor.

24. CTRC fails to specifically disclose an FMH7 field of an SNA protocol. However, Taylor discloses error information comprising an FMH7 field of an SNA protocol [page 68: FMH7]. When combined, the references disclose an error handling object that executes on said hardware and that receives an indication of an error from the second software object and packages the error into a form usable by the first environment or the first software object, wherein the indication of said error comprises an FMH7 field, and wherein said error handling object creates header information representative of the contents of said FMH7 field, said header information being adapted for use with an Internet protocol [Taylor: page 68: FMH7; CTRC: p.5 ¶4 – p.6 ¶2; Taylor: page 386 ¶ 2, integration of TCP/IP and SNA].

25. CTRC fails to specifically disclose a first object to read conversion information from a .TIM file that explains how to translate data types from the first system to the second system to a particular flow control and a second object to access end-to-end mapping information from the .TIM file to a particular flow control as claimed. However, Marcos teaches a first object to read conversion information from a .TIM file that explains how to translate data types from the first system to the second system to a particular flow control and a second object to access end-to-end mapping information

Art Unit: 2195

from the .TIM file to a particular flow control [col. 4 lines 1 – 45]. It would have been obvious to one of ordinary skill in the art at the time Applicant's invention was made to combine these references because both CTRC and Marcos disclose integrating different systems by providing communication between otherwise incompatible communication protocols and systems.

26. CTRC fails to specifically disclose first and second conversion components as claimed. However, Sun teaches the HIP system further including first and second conversion components, the first conversion component handling conversion issues related to aggregate data types and the second conversion component handling conversions issues related to primitive data types [col. 25 line 61 – col. 26 line 3]. It would have been obvious to one of ordinary skill in the art at the time Applicant's invention was made to combine these teachings because Sun teaches details of data transfer that are applicable to the system disclosed by CTRC.

27. As to claim 24, CTRC discloses the service object further receives a first reply from the second software object, converts the first reply to a second reply which is in a form usable by the first software object, and provides the second reply to the first software object [p.5 ¶4 – p.6 ¶2].

28. As to claim 25, CTRC discloses a listener object that executes on said hardware and that detects that a contact regarding the first request has been made by the first software object [p.5 ¶4 – p.6 ¶2].

29. As to claim 26, CTRC fails to specifically disclose queuing as claimed. However, Taylor discloses a queuing object that executes on said hardware and that queues at least one of connections and requests from the first system [p.44 ¶4 – 5].

30. As to claim 27, CTRC discloses that the service object comprises a transit object that receives information related to the first request from the first software object and prepares the information into a form that can be used for a call to the second software object [p.5 ¶4 – p.6 ¶2].

31. As to claim 28, CTRC discloses that the service object comprises an invocation object that lays out the information prepared by the transit object into a form that can be used for a call to the second software object, and that uses the laid out information to invoke the second software object [p.5 ¶4 – p.6 ¶2; p.7 ¶2].

32. As to claim 29, CTRC fails to specifically disclose a flow control object as claimed. However, Taylor discloses that the service object comprises a flow control object that manages the interaction of one or more components involved in the

conversion of the first request into the second request [p.922 “expedited flow”; p.925 “flow control”].

33. Claim 7 is rejected under 35 U.S.C. 103(a) as being unpatentable over CTRC in view of Taylor, Coulouris and Marcos as applied to claim 1 above, and further in view of Lymer et al. (US 6,230,117 B1; hereinafter Lymer).

34. As to claim 7, CTRC fails to specifically disclose a commarea as claimed. However, Lymer discloses that said first mechanism comprises a commarea that is used to pass a call parameter to said object and to receive a result from said object, and wherein said second mechanism comprises: a first area that is used to pass said call parameter, or a converted call parameter that corresponds to said call parameter, to said object; and a second area that is used to receive said result, or a converted result that corresponds to said result, from said object [Fig. 1; col. 3 line 61 - col. 4 line 4]. It would have been obvious to one of ordinary skill in the art at the time Applicant's invention was made to combine these references because both focus on interfacing between different computing environments.

35. Claims 14 – 20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Marcos et al. (US 6,347,342 B1; hereinafter Marcos) in view of CTRC (see reference V on PTO-892 mailed 31 August 2007), Taylor (see PTO-892 mailed 22 August 2006 and

31 August 2007 and 14 November 2007) and Coulouris (see PTO-892 mailed 14 November 2007).

36. As to claim 14, Marcos discloses a method of enabling a first software object in a first system to call a second software object in a second system [col. 4 lines 14 - 20], the method comprising:

evaluating first information that the first software object exposes when making a call to a remote system [col. 6 lines 50 - 65];

evaluating second information that the second software object exposes when receiving a call from a remote system [col. 7 lines 6 - 43];

generating conversion information descriptive of a process to be followed in order to convert the first information into a form compatible with the second information [col. 6 lines 50 - 65; col. 7 lines 6 - 43];

providing the conversion information to a conversion service that uses the conversion information to convert a first call from the first object into a call in a form usable by the second object [col. 6 lines 50 - 65; col. 7 lines 6 - 43] and a first object to read conversion information from a file that explains how to translate data types from the first system to the second system to a particular flow control and a second object to access end-to-end mapping information from the file to a particular flow control [col. 4 lines 1 - 45].

37. Marcos fails to specifically disclose conversion information describing the conversion of an FMH7 field into header information usable with an Internet protocol as claimed. However, CTRC teaches converting a field in an SNA protocol into header information usable with a TCP protocol [p. 5 ¶4 – p. 6 ¶2]. Furthermore, Taylor teaches FMH7 as a field in an SNA protocol [p. 68 FMH7]. The combination of Marcos, CTRC and Taylor teaches conversion information describing the conversion of an FMH7 field into header information usable with an Internet protocol as claimed.

38. It would have been obvious to one of ordinary skill in the art at the time Applicant's invention was made to combine these references because Marcos discloses providing communication between different systems without restricting the type of system or protocol, but does provide TCP/IP as a specific example [col. 4 lines 15 - 25; col. 8 lines 39 - 44] and CTRC and Taylor discloses integration of specific protocols.

39. Marcos also fails to specifically disclose a host initiated processing (HIP) system, listeners, HIP proxies and pre-stored configuration information as claimed. However, Taylor discloses said conversion service using a host initiated processing (HIP) system that includes one or more listeners for receiving the first request and one or more HIP proxies that handle flow control for the first conversion [p.138 “proxy”; p.314 ¶1; p.909 ¶ for “connection server”]. Furthermore, Coulouris teaches pre-stored configuration information to limit the number of threads that service requests [p.356 ¶4]. When combined with Taylor, the references teach the number of listeners and HIP proxies to

use in the first conversion is determined by an HIP runtime service based on pre-stored configuration information. It would have been obvious to one of ordinary skill in the art at the time Applicant's invention was made to combine these teachings because Coulouris teaches details of servers that are applicable to Marcos and Taylor.

40. As to claim 15, Marcos discloses that the first information comprises a call parameter in a first format, wherein the second information comprises a call parameter in a second format, and wherein the act of generating conversion information comprises generating code or data that describes how to convert a call parameter from the first format to the second format [col. 7 lines 6 - 23; col. 17 lines 9 - 21].

41. As to claim 16, Marcos discloses that the first information comprises a call parameter of a first data type which is not usable by the second software object [col. 15 line 62 - col. 16 line 4], and wherein the act of generating conversion information comprises:

generating a second data type that corresponds to the first data type and which is usable by the second software object [col. 7 lines 6 - 43];

generating code or data that describes how to convert data of the first data type to the second data type [col. 7 lines 6 -43].

42. As to claim 17, Marcos discloses that the first information comprises a return value in a first form, wherein the second information comprises a return value in a

second form different from said first form, and wherein the act of generating conversion information comprises generating code or data that describes how to convert data in said first form to said second form [col. 4 lines 14 - 20; col. 7 lines 6 - 43, 55 - 67].

43. As to claim 18, Marcos discloses that said first software object makes a call to a remote system according to a first programming model, wherein said second data object receives a call from a remote system according to a second programming model, and wherein the act of generating conversion information comprises generating code or data that indicates which programming model the first software object uses to make a remote call [col. 7 lines 24 - 43].

44. As to claim 19, Marcos discloses that the act of generating conversion information comprises generating code or data that describes at least one customization in converting from the first programming model to the second programming model [col. 7 lines 6 - 43].

45. As to claim 20, Marcos discloses that the act of generating conversion information comprises generating a transaction initiation message that is used in invoking the second software object or in reply to the first software object [col. 7 lines 6 - 23; col. 10 line 43 - col. 11 line 14].

Conclusion

Art Unit: 2195

46. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

47. Any inquiry concerning this communication or earlier communications from the examiner should be directed to NATHAN PRICE whose telephone number is (571)272-4196. The examiner can normally be reached on 6:00am - 2:30pm, Monday - Friday.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Meng-Ai An can be reached on (571) 272-3756. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
